

IN THE CLAIMS

Please amend claims 1, 12, and 23 as follows:

1. (CURRENTLY AMENDED) A method of maintaining cache in a clustered environment comprising:
  - receiving an I/O request for modifying data in a primary node of a storage cluster of two or more nodes ~~for accessing data~~;
  - storing the modified data in cache of the primary node;
  - selecting a secondary node for storing the modified data in the secondary node's cache based on a historic point of access list maintained in a cache directory, wherein the historic point of access list identifies which node's cache contains which data;
  - forwarding the modified data and symbolic information to one or more relevant nodes in the storage cluster, wherein the symbolic information identifies the primary and secondary nodes as containing the modified data; and
  - updating the historic point of access list based on the symbolic information.
2. (ORIGINAL) The method of claim 1 wherein the request is to write data.
3. (ORIGINAL) The method of claim 1 wherein:
  - the historic point of access indicates that the data is not currently in cache of any node of the storage cluster; and
  - the secondary node selected is any node in the storage cluster.
4. (ORIGINAL) The method of claim 1 wherein:
  - the historic point of access indicates that an original primary node maintains the data in cache; and
  - the secondary node selected is the original primary node.
5. (ORIGINAL) The method of claim 1 wherein:
  - the symbolic information includes information relating to the first node; and
  - the historic point of access list is updated by:

listing the first node as the primary node; and  
listing the secondary node as the secondary node.

6. (ORIGINAL) The method of claim 1 further comprising selecting a remote node that is an original secondary node in the historic point of access list maintained in the cache directory.

7. (ORIGINAL) The method of claim 1 wherein:  
a copy of the modified data is maintained in the first node and the secondary node; and  
the symbolic information is maintained in remaining nodes of the storage cluster.

8. (ORIGINAL) The method of claim 1 further comprising acquiring a lock on associated tracks on nodes in the storage cluster wherein the locking protocol provides for multiple readers and a single writer.

9. (ORIGINAL) The method of claim 1 further comprising:  
detecting a failure of a node in the storage cluster;  
broadcasting a failover recovery message to all nodes in the storage cluster; and  
replicating the data from the primary node or the secondary node to another node in the storage cluster.

10. (ORIGINAL) The method of claim 1 further comprising:  
detecting a failure of a node in the storage cluster;  
broadcasting a failover recovery message to all nodes in the storage cluster; and  
destaging the data from the primary node or the secondary node to disk.

11. (ORIGINAL) The method of claim 1 further comprising:  
applying for cluster admission;  
requesting the symbolic information for new write requests;

requesting a modified track list comprising an identifier of modified data and an associated symbolic entry;

merging the modified track list with any new symbolic entries; and

broadcasting availability to remaining nodes in the storage cluster.

12. (CURRENTLY AMENDED) An apparatus for maintaining cache in a clustered environment comprising:

(a) a cache;

(b) a cache directory comprising a historic point of access list for the cache, wherein the historic point of access list identifies which node's cache contains which data;

(ac) a storage node organized in a storage cluster and having an interface for connecting to a host, a storage disk, and one or more additional storage nodes, wherein the storage node maintains cache and the cache directory, and wherein the storage node is configured to:

- (i) receive an I/O request for accessing/modifying data;
- (ii) store the modified data in the cache of the storage node;
- (iii) select a secondary node for storing data in the secondary node's cache based on the historic point of access list;
- (iiiv) forward the modified data and symbolic information to one or more additional storage nodes in the storage cluster, wherein the symbolic information identifies a primary node and the secondary node as containing the modified data; and
- (iv) update the historic point of access list based on the symbolic information.

13. (ORIGINAL) The apparatus of claim 12 wherein the request is to write data.

14. (ORIGINAL) The apparatus of claim 12 wherein:  
the historic point of access indicates that the data is not currently in cache of the nodes in the storage cluster; and  
the secondary node selected is any node in the storage cluster.

15. (ORIGINAL) The apparatus of claim 12 wherein:

the historic point of access indicates that an original primary node maintains the data in cache; and

the secondary node selected is the original primary node.

16. (ORIGINAL) The apparatus of claim 12 wherein:  
the symbolic information includes information relating to a first node that receives the request; and  
the historic point of access list is updated by:  
listing the first node as the primary node; and  
listing the secondary node as the secondary node.

17. (ORIGINAL) The apparatus of claim 12, wherein the storage node is further configured to select a remote node that is an original secondary node in the historic point of access list maintained in the cache directory.

18. (ORIGINAL) The apparatus of claim 12 wherein:  
a copy of the modified data is maintained in two nodes in the storage cluster; and  
the symbolic information is maintained in remaining nodes of the storage cluster.

19. (ORIGINAL) The apparatus of claim 12, wherein the storage node is further configured to acquire a lock on associated tracks on relevant nodes in the storage cluster wherein the locking protocol provides for multiple readers and a single writer.

20. (ORIGINAL) The apparatus of claim 12, wherein the storage node is further configured to:  
detect a failure of a node in the storage cluster;  
broadcast a failover recovery message to an additional storage node in the storage cluster;  
and  
replicate the data from one node in the storage cluster to another node in the storage cluster.

21. (ORIGINAL) The apparatus of claim 12, wherein the storage node is further configured to:

detect a failure of a node in the storage cluster;  
broadcast a failover recovery message to an additional node in the storage cluster; and  
destage the data from a node in the storage cluster to disk.

22. (ORIGINAL) The apparatus of claim 12 further comprising a new node configured to:

apply for cluster admission;  
request the symbolic information for new write requests;  
request a modified track list comprising an identifier of modified data and an associated symbolic entry;  
merge the modified track list with any new symbolic entries; and  
broadcast availability to remaining nodes in the storage cluster.

23. (CURRENTLY AMENDED) An article of manufacture, embodying logic to perform a method of maintaining cache in a clustered environment, the method comprising:

receiving an I/O request, for modifying data, in a primary node of a storage cluster for accessing data of two or more nodes;

storing the modified data in cache of the primary node;

selecting a secondary node for storing the modified data in the secondary node's cache based on a historic point of access list maintained in a cache directory, wherein the historic point of access list identifies which node's cache contains which data;

forwarding the modified data and symbolic information to one or more relevant nodes in the storage cluster, wherein the symbolic information identifies the primary and secondary nodes as containing the modified data; and

updating the historic point of access list based on the symbolic information.

24. (ORIGINAL) The article of manufacture 23 wherein the request is to write data.

25. (ORIGINAL) The article of manufacture 23 wherein:  
the historic point of access indicates that the data is not currently in cache of any node of the storage cluster; and  
the secondary node selected is any node in the storage cluster.
26. (ORIGINAL) The article of manufacture 23 wherein:  
the historic point of access indicates that an original primary node maintains the data in cache; and  
the secondary node selected is the original primary node.
27. (ORIGINAL) The article of manufacture 23 wherein:  
the symbolic information includes information relating to the first node; and  
the historic point of access list is updated by:  
listing the first node as the primary node; and  
listing the secondary node as the secondary node.
28. (ORIGINAL) The article of manufacture 23, the method further comprising  
selecting a remote node that is an original secondary node in the historic point of access list  
maintained in the cache directory.
29. (ORIGINAL) The article of manufacture 23 wherein:  
a copy of the modified data is maintained in the first node and the secondary node; and  
the symbolic information is maintained in remaining nodes of the storage cluster.
30. (ORIGINAL) The article of manufacture 23, the method further comprising  
acquiring a lock on associated tracks on nodes in the storage cluster wherein the locking protocol  
provides for multiple readers and a single writer.
31. (ORIGINAL) The article of manufacture 23, the method further comprising:  
detecting a failure of a node in the storage cluster;

broadcasting a failover recovery message to all nodes in the storage cluster; and  
replicating the data from the primary node or the secondary node to another node in the  
storage cluster.

32. (ORIGINAL) The article of manufacture 23, the method further comprising:  
detecting a failure of a node in the storage cluster;  
broadcasting a failover recovery message to all nodes in the storage cluster; and  
destaging the data from the primary node or the secondary node to disk.

33. (ORIGINAL) The article of manufacture 23, the method further comprising:  
applying for cluster admission;  
requesting the symbolic information for new write requests;  
requesting a modified track list comprising an identifier of modified data and an associated  
symbolic entry;  
merging the modified track list with any new symbolic entries; and  
broadcasting availability to remaining nodes in the storage cluster.
